<tbody>
<tr>
<td>Short/Other Names</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

This indicator measures the rate of nursing-sensitive adverse events for all medical patients. The following adverse events are captured in this indicator:

- Urinary tract infections (UTIs)
- Pressure ulcers
- In-hospital fractures
- Pneumonia

For further details, please see the General Methodology Notes.

#### Interpretation

Lower rates are desirable.

High or low rates for this indicator must be interpreted with caution as they may be a consequence of inconsistent coding practices by hospitals when reporting post-admission adverse events to the DAD.

#### HSP Framework Dimension

Health System Outputs: Safe

#### Areas of Need

Getting Better

#### Geographic Coverage

All provinces/territories except Quebec

#### Reporting Level/Disaggregation

National, Province/Territory, Region, Facility, Peer Group

#### Identifying Information

Name | Nursing-Sensitive Adverse Events for Medical Patients
Short/Other Names | Not applicable

### Indicator Description and Calculation

#### Description

This indicator measures the rate of nursing-sensitive adverse events for all medical patients. The following adverse events are captured in this indicator:

- Urinary tract infections (UTIs)
- Pressure ulcers
- In-hospital fractures
- Pneumonia

For further details, please see the General Methodology Notes.

The indicator is expressed as a rate of nursing-sensitive adverse events per 1,000 medical discharges.

#### Calculation: Description

Risk-adjusted rate = Observed cases ÷ Expected cases × Canadian average

#### Calculation: Geographic Assignment

Place of service

#### Calculation: Type of Measurement

Rate - per 1,000

The following covariates are used in risk adjustment:

For a detailed list of covariates used in the model, please refer to the Model Specification document.

#### Calculation: Adjustment Applied

Logistic regression

#### Calculation: Method of Adjustment

**Description:**

Acute care hospitalizations with medical conditions

**Inclusions:**

1. Admission to an acute care institution (Facility Type Code = 1)
2. Patients within the medical patient group (MCC diagnostic partition)
3. Age at admission 55 years and older
4. Sex recorded as male or female

**Exclusions:**

1. Obstetric (MCC 13), neonatal (MCC 14) or mental health (MCC 17) patients
2. Records with admission category of cadaveric donor or stillbirth (Admission Category Code = R or S)

**Description:**

Cases within the denominator with one or more adverse events

**Inclusions:**

One of the following ICD-10-CA codes, coded as type 2 (except where specified):
Urinary tract infection (UTI):

- Site not specified (N39.0)
- 2012-2013 onward: Related to Foley catheter (T83.5 [type 2] + N39.0 [type 3] + Y84.6 [type 9] all within same diagnostic cluster)

Pressure ulcers:

- Decubitus ulcer (L89)

In-hospital fractures:

- Fracture of shoulder and upper arm (S42)
- Fracture of forearm (S52)
- Fracture at wrist and hand level (S62)
- Fracture of femur (S72)
- Fracture of lower leg, including ankle (includes malleolus) (S82)
- Fracture of foot, except ankle (S92)
- Fractures involving multiple regions of one upper limb (T02.2)
- Fractures involving multiple regions of one lower limb (T02.3)
- Fractures involving multiple regions of both upper limbs (T02.4)
- Fractures involving multiple regions of both lower limbs (T02.5)
- Fractures involving multiple regions of upper limb(s) (T02.6)
- Fracture of upper limb, level unspecified (T10)
- Fracture of lower limb, level unspecified (T12)

Pneumonia:

- Non-viral pneumonia (J13, J14, J15, J16, J18, J85.1 or J69.0)
- 2013-2014 onward: Ventilator-assisted pneumonias* (J95.88 [type 2] + J15 [type 3], J16.8 [type 3], J18 [type 3] or J85.1 [type 3] + Y60-Y84 [type 9], all within same diagnosis cluster)

*For ventilator-assisted pneumonias, all 3 conditions must be present on the same abstract and all 3 conditions must have the same cluster code that is not blank.

Background, Interpretation and Benchmarks

A study of adverse events estimated that approximately 70,000 preventable adverse events occur annually in Canadian hospitals. Based on the definition used by the World Health Organization and other studies, adverse events refer to incidents caused by medical management instead of complications of disease.

Some studies have found that adverse events increase the costs of patient care and have suggested that nurse staffing, in particular, is associated with adverse events such as pneumonia, urinary tract infections, pressure ulcers and in-hospital falls.

While nurses are not solely responsible for adverse events that occur in hospital, many believe that there is a strong relationship between nurse staffing and patient outcomes. This indicator can help hospitals identify potential issues in nursing care. Further investigation and analysis based on the indicator results may possibly lead to quality improvement in nursing care.

Lower rates are desirable.

Interpretation

High or low rates for this indicator must be interpreted with caution as they may be a consequence of inconsistent coding practices by hospitals when reporting post-admission adverse events to the DAD.
