Nursing-Sensitive Adverse Events for Medical Patients

Name: Nursing-Sensitive Adverse Events for Medical Patients

Short/Other Names: Not applicable

Description: This indicator measures the rate of nursing-sensitive adverse events for all medical patients. The following adverse events are captured in this indicator:

- Urinary tract infections (UTIs)
- Pressure ulcers
- In-hospital fractures
- Pneumonia

For further details, please see the General Methodology Notes.

Interpretation: Lower rates are desirable.

High or low rates for this indicator must be interpreted with caution as they may be a consequence of inconsistent coding practices by hospitals when reporting post-admission adverse events to the DAD.

HSP Framework Dimension: Health System Outputs: Safe

Areas of Need: Getting Better

Geographic Coverage: All provinces/territories except Quebec

Reporting Level/Disaggregation: National, Province/Territory, Region, Facility, Peer Group

Indicator Results: https://www.cihi.ca/en/cihi-health-indicators

Identifying Information

Name: Nursing-Sensitive Adverse Events for Medical Patients

Short/Other Names: Not applicable

Indicator Description and Calculation

This indicator measures the rate of nursing-sensitive adverse events for all medical patients. The following adverse events are captured in this indicator:

- Urinary tract infections (UTIs)
- Pressure ulcers
- In-hospital fractures
- Pneumonia

For further details, please see the General Methodology Notes.

The indicator is expressed as a rate of nursing-sensitive adverse events per 1,000 medical discharges.

Risk-adjusted rate = Observed cases ÷ Expected cases × Canadian average

Unit of analysis: Single admission

The following covariates are used in risk adjustment:

For a detailed list of covariates used in the model, please refer to the Model Specification document.

Calculation: Method of Adjustment

Logistic regression

Denominator Description:

Acute care hospitalizations with medical conditions

Inclusions:

1. Admission to an acute care institution (Facility Type Code = 1)
2. Patients within the medical patient group (MCC diagnostic partition)
3. Age at admission 55 years and older
4. Sex recorded as male or female

Exclusions:

1. Obstetric (MCC 13), neonatal (MCC 14) or mental health (MCC 17) patients
2. Records with admission category of cadaveric donor or stillbirth (Admission Category Code = R or S)
Description:
Cases within the denominator with one or more adverse events

Inclusions:
One of the following ICD-10-CA codes, coded as type 2 (except where specified):

Urinary tract infection (UTI):
- Site not specified (N39.0)
- 2012-2013 onward: Related to Foley catheter (T83.5 [type 2] + N39.0 [type 3] + Y84.6 [type 9] all within same diagnostic cluster)

Pressure ulcers:
- Decubitus ulcer (L89)

In-hospital fractures:
- Fracture of shoulder and upper arm (S42)
- Fracture of forearm (S52)
- Fracture at wrist and hand level (S62)
- Fracture of femur (S72)
- Fracture of lower leg, including ankle (includes malleolus) (S82)
- Fracture of foot, except ankle (S92)
- Fractures involving multiple regions of one upper limb (T02.2)
- Fractures involving multiple regions of one lower limb (T02.3)
- Fractures involving multiple regions of both upper limbs (T02.4)
- Fractures involving multiple regions of both lower limbs (T02.5)
- Fractures involving multiple regions of upper limb(s) (T02.6)
- Fracture of upper limb, level unspecified (T10)
- Fracture of lower limb, level unspecified (T12)

Pneumonia:
- Non-viral pneumonia (J13, J14, J15, J16, J18, J85.1 or J69.0)
- 2013-2014 onward: Ventilator-assisted pneumonias* (J95.88 [type 2] + J15 [type 3], J16.8 [type 3], J18 [type 3] or J85.1 [type 3] + Y60-Y84 [type 9], all within same diagnosis cluster)
  *For ventilator-assisted pneumonias, all 3 conditions must be present on the same abstract and all 3 conditions must have the same cluster code that is not blank.

Background, Interpretation and Benchmarks

A study of adverse events estimated that approximately 70,000 preventable adverse events occur annually in Canadian hospitals. Based on the definition used by the World Health Organization and other studies, adverse events refer to incidents caused by medical management instead of complications of disease.

Some studies have found that adverse events increase the costs of patient care and have suggested that nurse staffing, in particular, is associated with adverse events such as pneumonia, urinary tract infections, pressure ulcers and in-hospital falls.

While nurses are not solely responsible for adverse events that occur in hospital, many believe that there is a strong relationship between nurse staffing and patient outcomes. This indicator can help hospitals identify potential issues in nursing care. Further investigation and analysis based on the indicator results may possibly lead to quality improvement in nursing care.

Lower rates are desirable.

Rationale

Interpretation

High or low rates for this indicator must be interpreted with caution as they may be a consequence of inconsistent coding practices by hospitals when reporting post-admission adverse events to the DAD.
