Executive summary

For most people, primary care clinicians such as family doctors and nurses are the first point of contact with the health care system. This report presents analyses from the Canadian Institute for Health Information (CIHI) on the results of the Commonwealth Fund (CMWF) International Health Policy Survey of Primary Care Physicians. Comparisons of Canadian primary care physicians' experiences with those of primary care physicians in 10 other developed countries provide important perspectives on how well primary care works in Canada and where improvements still need to be made from the point of view of primary care physicians.

Across Canada, there have been many efforts to improve the delivery of primary care. The results of the CMWF survey show that Canada has been implementing best practices in organizing care to improve access, provide patient-centred care and adopt information technologies. That said, Canada lags behind other CMWF countries in using electronic information systems in physician practices and in coordinating care. There is also substantial variation between jurisdictions in many areas, suggesting that there are ways to learn from the most effective policies and programs across the country and internationally.

Key findings from this year's survey

Profile of primary care physicians and their practices

- There were more physician group practices in Canada in 2019 than in 2015 (65% versus 60%), reflecting a trend away from solo practices. Notably, there is wide variation across the country in how practices are organized.
- More primary care physicians found their jobs stressful in 2019 than in 2015 (46% versus 27%). A similar trend was seen in the other CMWF countries.

Access to care

- More Canadian primary care physicians offer weeknight (57%) and weekend (50%) appointments compared with the CMWF average (weeknight: 44%; weekend: 36%). However, only 49% of Canadian primary care physicians have arrangements for patients to be seen when their practices are closed, lower than the CMWF average (75%).
- 22% of Canadian primary care physicians offered patients the option to request appointments online in 2019, compared with 11% in 2015.
- Fewer Canadian primary care physicians (23%) offer patients the option to ask medical questions via email or a secure website compared with the CMWF average (65%). There are also fewer Canadian primary care physicians (18%) who frequently make home visits compared with the CMWF average (42%).

Patient-centred care

- The majority of Canadian primary care physicians feel well prepared to care for patients with chronic conditions (82%). In contrast, fewer Canadian primary care physicians feel prepared to care for patients with specialized needs, particularly dementia (40%), palliative care (36%) and substance use (19%). In Canada, 13% of primary care physicians reported feeling well prepared to care for patients requesting medical assistance in dying.

Coordination within the health system and with social services

- Fewer Canadian primary care physicians communicate with home care providers about their patients' needs (24%) compared with the CMWF average (31%). However, about the same proportion of Canadian physicians receives updates about their patients (36%) as the CMWF average (37%).
- Although many Canadian primary care physicians (60%) screen their patients for social needs, fewer frequently coordinate care with social services (43%). One of the biggest challenges is inadequate staffing to make referrals and coordinate (43%), though the top challenge differs across jurisdictions.
- 65% of Canadian primary care physicians think that better integration of primary care with hospitals, mental health services and community-based social services is the top priority in improving quality of care and patient access.

Coordination using information technologies

- More Canadian primary care physicians were using electronic medical records (EMRs) in 2019 (86%) than in 2015 (73%), but this was still lower than the CMWF average (93%).
- Fewer Canadian primary care practices offer their patients the option to electronically view their patient visit summaries online (Canada: 5%; CMWF: 26%) and request prescription renewals online (Canada: 10%; CMWF: 52%). Similarly, compared with the CMWF average, fewer Canadian primary care practices can exchange information electronically with doctors outside their practice, including patient clinical summaries (Canada: 25%; CMWF: 63%), laboratory and diagnostic test results (Canada: 36%; CMWF: 65%) and lists of medications taken by their patients (Canada: 33%; CMWF: 62%).
- Compared with the CMWF average, fewer Canadian primary care physicians review their performance on clinical outcomes (Canada: 34%; CMWF: 60%), patients' hospital admissions (Canada: 25%; CMWF: 32%), prescribing practices (Canada: 26%; CMWF: 58%), surveys of patient satisfaction and experiences with care (Canada: 17%; CMWF: 38%) and surveys of patient-reported outcome measures (Canada: 8%; CMWF: 22%).

Acknowledgements

The Commonwealth Fund provided core support, with cofunding from the German Federal Ministry of Health and the German Institute for Quality Assurance and Transparency in Healthcare (Germany); the Haute autorité de santé, Caisse nationale de l'assurance maladie and the Directorate for Research, Evaluation, Studies, and Statistics of the French Ministry of Health (France); the Dutch Ministry of Health, Welfare, and Sport, and Radboud University Medical Center (the Netherlands); the Norwegian Institute of Public Health (Norway); the Swedish Agency for Health and Care Services Analysis (Sweden); and the Swiss Federal Office of Public Health (Switzerland). Additional support to fund expanded samples was provided by the New South Wales Agency for Clinical Innovation and the Department of Health and Human Services (Australia); the Canadian Institute for Health Information, Canada Health Infoway, the ministère de la Santé et des Services sociaux du Québec and Health Quality Ontario (Canada); and the Health Foundation of the United Kingdom (U.K.).

Within Canada, funding for an expanded Canadian sample was provided by CIHI, Canada Health Infoway, the ministère de la Santé et des Services sociaux du Québec and Health Quality Ontario.

CIHI would like to acknowledge and thank the many individuals who assisted with the development of this report, including our Expert Advisory Group:

- **Dr. Mike Benigeri**, Consultant
- **Caroline Boucher**, Strategic Planning Advisor, ministère de la Santé et des Services sociaux du Québec
- **Dr. Bidénam Kambia-Chopin**, Performance Appraisal Resource Officer, Commissaire à la santé et au bien-être du Québec
- **Dr. Susan Chatwood**, Scientific Director, Institute for Circumpolar Health Research
- **Tara S. Chauhan**, Senior Advisor, Canadian Medical Association
- **Dr. Gail Dobell**, Interim Vice President, Health System Performance, Health Quality Ontario
- **Annette McKinnon**, patient representative
- **Michelina Mancuso**, Executive Director, Performance Measurement, New Brunswick Health Council
- **Dr. Alex Singer**, Director, Manitoba Primary Care Research Network
- **Sukirtha Tharmalingam**, Manager, Evaluation Methods, Canada Health Infoway

Please note that the analyses and conclusions in the present document do not necessarily reflect those of the individuals or organizations mentioned above.

Appreciation goes to the CIHI staff on the core team as well as in the supporting program areas who contributed to the development of this project.

About this report

The 2019 edition of the CMWF's International Health Policy Survey focused on the views and experiences of primary care doctors. This report highlights the Canadian story and examines how these experiences vary across Canada and relative to other developed countries, as well as how they are changing over time.

For the first time, primary care physicians from all Canadian jurisdictions were represented in this survey. In all provinces except Prince Edward Island, random samples of primary care physicians were selected. In P.E.I. and the territories, censuses of all primary care physicians were conducted. However, the final number of responses in the territories was small and the territorial results were aggregated together as “total territories.” Since the territories are different from one another and “total territories” does not represent a single jurisdiction, “total territories” results were not compared against the CMWF average using statistical tests.

Supplementary data tables are available online. These show more detailed responses to the questions presented here, as well as some additional questions not covered in the report. Full data sets of the survey results are available to researchers upon request by writing to cmwf@cihi.ca. As well, a chartbook version of this report with visuals is available on CIHI's website.

Interpreting results

CIHI applied statistical methods to determine whether Canadian and provincial results were significantly different from the international average of 11 countries. Results are presented throughout the report using the following symbols to indicate statistical significance and the desirable direction of the indicator:

Results with a desirable direction

- a: Above average
- b: Same as average
- c: Below average

Results without a clear desirable direction

- d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories)

Above-average results are more desirable relative to the international average, while below-average results often indicate areas for improvement.

Sample sizes in some provinces are much smaller than in others and have wider margins of error. For this reason, 2 provinces may have the same numeric results with different statistical differences (e.g., one result might be same as average, while the other is below average). The wider the margin of error, the more difficult it is for a result to show up as significantly different from the average. The most robust samples are in Quebec and Ontario because of the additional funding from those provinces.

To assess the reliability of the results, coefficient of variation (CV) was calculated. CV is the standard error of an estimate expressed as a percentage of the estimate and is a measure of sampling error. Estimates with a CV less than 16.6% are considered reliable for general use. Estimates with a CV between 16.6% and 33.3% are considered to have high levels of error, and caution should be exercised; results with such CV values are flagged with an asterisk (*). Estimates with a CV higher than 33.3% are considered unreliable and are suppressed, as indicated with an em dash (—). These quality level guidelines are consistent with those used at Statistics Canada.¹

Some of the questions were part of the Canadian survey only and were not asked in other countries. International comparison is therefore not possible. Findings for these questions are labelled “Canada only” in this report.

To examine possible relationships between survey questions, logistic regression modelling was performed.

To provide additional context, this report also references information from CIHI and other sources. References can be found at the end of the report.

Reporting framework

The report is organized in a way that reflects how primary care physicians interact with their patients, other parts of the health system and the social system. First, it describes the practice characteristics of primary care physicians. Next, it examines how primary care practices provide access to care for patients and patient-centred care, as well as how they coordinate care with other parts of the health system and with social services. Lastly, the report explores how primary care physicians use information technology to support coordination and their overall perceptions of the health system.

Note: In Quebec, social services are an integral part of the health system (ministère de la Santé et des Services sociaux du Québec).

Profile of primary care physicians and their practices

Key findings

- Canadian physicians see a median of 100 patients a week, similar to the 11-country average of medians (99 patients a week). 55% of Canadian primary care physicians spend 15 to less than 25 minutes with each patient, similar to the CMWF average (54%). Most Canadian primary care practices (61%) are not accepting new patients.
- There were more physician group practices in Canada in 2019 than in 2015 (65% versus 60%), reflecting a trend away from solo practices. Notably, there is wide variation across the country in how practices are organized.
- Slightly fewer Canadian primary care physicians are extremely, very or moderately satisfied with practising medicine (88%) and with their income from medical practice (76%) compared with the CMWF average (91% and 80%, respectively). However, slightly more Canadian primary care physicians are satisfied with their time spent per patient (69%) and daily workload (57%) compared with the CMWF average (62% and 52%, respectively).
- More primary care physicians found their jobs stressful in 2019 than in 2015 (46% versus 27%). A similar trend was seen in the other CMWF countries (2015: 35%; 2019: 45%).

More Canadian primary care physicians worked in physician group practices in 2019 than in 2015 (Canada only)

Table 1 Primary practice site, trend over time, percentage, Canada

| Primary practice site | 2015 | 2019 |
|--------------------------------|------|------|
| Private solo practice | 20 | 15 |
| Physician group practice | 60 | 65 |
| Community clinic/health centre | 13 | 12 |
| Hospital-based practice | 4 | 5 |

Variation across jurisdictions in primary care practice organization (Canada only)

| Terr. | — | 45 | 39* | — |
| Can. | 15 | 65 | 12 | 5 |

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

— Data is suppressed due to extreme sampling variability (CV>33.3%).

The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Differences between solo and group physician practices

Table 3 Proportion of primary care practices that do the following, by type of practice, Canada

| Activities | Private solo practice | Physician group practice |
|--|-----------------------|--------------------------|
| Offer appointments on the weekend (i.e., Saturday or Sunday) | 38 | 56 |
| Use personnel, such as nurses or case managers, to monitor and manage care for patients with chronic conditions that need regular follow-up care | 44 | 62 |
| Use electronic patient medical records (not including billing systems) | 62 | 93 |
| Offer patients the option to request appointments online | 9 | 28 |
| Receive and review data on surveys of patient satisfaction and experiences with care quarterly or yearly | 9 | 16 |

Canadian primary care physicians see 100 patients a week, with variability across jurisdictions

Table 4a Median number of patients seen during a typical workweek, by country

| Country | Median patients seen |
|----------------|----------------------|
| Germany | 200 |
| France | 120 |
| Australia | 110 |
| United Kingdom | 100 |
| Netherlands | 100 |
| Canada | 100 ^d |

| N.L. | 125 |
| P.E.I. | 100 |
| N.S. | 112 |
| N.B. | 110 |
| Que. | 70 |
| Ont. | 100 |
| Man. | 100 |
| Sask. | 120 |
| Alta. | 100 |
| B.C. | 120 |
| Terr. | 70 |

Notes

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The Canadian median represents the median experience of Canadians (as opposed to the average of provincial and territorial medians).

In 2016, 85% of Canadians had a regular doctor or place where they received care.²

Canadian physicians work similar hours as CMWF average

Table 5 Proportion of primary care physicians by the number of hours they typically work each week in their medical practice, by country

| Country | Less than 35 hours | 35 to less than 45 hours | 45 or more hours |
|----------------|--------------------|--------------------------|------------------|
| France | 5 | 22 | 73 |
| Germany | 5 | 16 | 78 |
| Norway | 8 | 21 | 72 |
| Netherlands | 9 | 23 | 68 |
| United States | 13 | 22 | 65 |
| Canada | 18 | 26 | 55 |
| CMWF average | 20 | 26 | 54 |
| Switzerland | 26 | 20 | 55 |
| United Kingdom | 30 | 32 | 39 |
| Sweden | 32 | 37 | 31 |
| New Zealand | 36 | 36 | 28 |
| Australia | 38 | 32 | 30 |

Note

Including all hours they work across practices, including hours worked at home and on call.

In addition to clinical activities as measured here, primary care physicians may work in teaching, health facility committees, administration, research and continuing medical education/continuing professional development.³

Canadian primary care physicians spend similar amount of time with patients as CMWF average

Table 6 Proportion of primary care physicians by the **average** amount of time they are able to spend with a patient during a routine office visit, by country

| Country | Less than 15 minutes | 15 to less than 25 minutes | 25 minutes or more |
|----------------|----------------------|----------------------------|--------------------|
| Sweden | 2 | 44 | 54 |
| Norway | 3 | 86 | 12 |
| Switzerland | 6 | 66 | 27 |
| France | 8 | 82 | 10 |
| New Zealand | 10 | 87 | 3 |
| United States | 16 | 63 | 21 |
| Australia | 25 | 70 | 5 |
| Canada | 28 | 55 | 18 |
| CMWF average | 32 | 54 | 14 |
| Netherlands | 85 | 15 | 0 |
| Germany | 85 | 12 | 2 |
| United Kingdom | 86 | 14 | 0 |

Compared with 2015, there were no significant changes in the amount of time Canadian primary care physicians were able to spend with patients during routine office visits.⁴

Physician satisfaction by time spent with patients

Table 7 Proportion of Canadian primary care physicians who are **extremely, very or moderately satisfied** with the time they can spend with patients, by the amount of time they are able to spend with patients during routine office visits

| Amount of time | Extremely, very or moderately satisfied |
|----------------------------|---|
| Less than 15 minutes | 53 |
| 15 to less than 25 minutes | 72 |
| 25 minutes or more | 82 |

57% of Canadians feel that their regular doctor **always** spends enough time with them when they need care or treatment.²

Provincial and territorial snapshot: Time

Table 8a Proportion of primary care physicians by the number of hours they typically work each week in their medical practice, by jurisdiction ^d

| Amount of time | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. | CMWF avg. |
|--------------------------|------|--------|------|------|------|------|------|-------|-------|------|-------|------|-----------|
| Less than 35 hours | 9* | — | 13* | 14* | 29 | 17 | 12* | 9* | 13* | 19* | — | 18 | 20 |
| 35 to less than 45 hours | 25 | 22* | 20* | 20* | 27 | 30 | 17* | 13* | 27 | 24 | 25* | 26 | 26 |
| 45 or more hours | 66 | 65 | 67 | 66 | 44 | 53 | 72 | 77 | 61 | 57 | 60 | 55 | 54 |

Table 8b Proportion of primary care physicians by the **average** amount of time they are able to spend with a patient during a routine office visit, by jurisdiction ^d

| Amount of time | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. | CMWF avg. |
|----------------------------|------|--------|------|------|------|------|------|-------|-------|------|-------|------|-----------|
| Less than 15 minutes | 43 | 34* | 28 | 34 | 2* | 34 | 29 | 34 | 19* | 58 | — | 28 | 32 |
| 15 to less than 25 minutes | 49 | 63 | 62 | 61 | 50 | 58 | 58 | 57 | 69 | 36 | 77 | 55 | 54 |
| 25 minutes or more | 8* | — | 10* | — | 48 | 7 | 13* | 9* | 12* | — | — | 18 | 14 |

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

— Data is suppressed due to extreme sampling variability (CV>33.3%).

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Typical hours of work include all hours physicians work across practices, including hours worked at home and on call.

About two-thirds of Canadian primary care practices not accepting new patients (Canada only)

Table 9a Proportion of primary care physicians who have the capacity to accept new patients in their main care setting, considering their roster and work schedule, Canada

| Capacity (yes/no) | Percentage |
|---|------------|
| Yes, have the capacity and accepting all patients who inquire | 16 |
| Yes, have the capacity and accepting only patients who fit certain criteria | 22 |
| Yes, have the capacity but not accepting new patients | 9 |
| No, do not have the capacity | 52 |

Table 9b Of those who have the capacity and are accepting new patients, proportion of primary care physicians who use the following strategies,[†] Canada

| Strategy | Percentage |
|--|------------|
| Use a waiting list maintained by the clinic | 46 |
| Use the public waiting list of patients maintained by the government | 36 |
| Put your name in the government list of available doctors | 33 |
| Use other strategies to fill capacity | 59 |

Notes

[†] Excludes respondents who answered “not applicable” for each strategy. Multiple responses were allowed, so the sum of responses does not total 100%.

Fewer Canadian primary care physicians satisfied with practising medicine and with their income compared with CMWF average

Table 10a Proportion of primary care physicians who are **extremely, very or moderately satisfied** with practising medicine, by country

| Country | Percentage |
|----------------|-----------------|
| Switzerland | 98 |
| Australia | 96 |
| Netherlands | 95 |
| New Zealand | 93 |
| Norway | 92 |
| France | 91 |
| CMWF average | 91 |
| Sweden | 88 |
| Canada | 88 ^c |
| Germany | 88 |
| United Kingdom | 85 |
| United States | 84 |

Table 10b Proportion of primary care physicians who are **extremely, very or moderately satisfied** with the following aspects of their medical practice

| Aspects of medical practice | Canada | CMWF average |
|-------------------------------------|-----------------|--------------|
| Their income from medical practice | 76 ^c | 80 |
| The time they can spend per patient | 69 ^a | 62 |
| Their daily workload | 57 ^a | 52 |

Notes

a: Above average.

c: Below average.

The Netherlands is excluded from Table 10b as it used a different scale.

Increasing proportion of Canadian primary care physicians find their jobs extremely or very stressful

Table 11a Proportion of primary care physicians who feel **extremely or very stressed** with their job as a primary care physician, by country

| Germany | 52 |
| United States | 53 |
| United Kingdom | 60 |
| Sweden | 65 |

Table 11b Trend over time, proportion of primary care physicians who feel **extremely** or **very stressed** with their job as a primary care physician

| Country | 2015 | 2019 |
|--------------|------|-----------------|
| Canada | 27 | 46 ^b |
| CMWF average | 35 | 45 |

Notes

b: Same as average.
Lower numbers are desirable.

Provincial and territorial snapshot: Satisfaction and stress

Table 12a Proportion of primary care physicians who are **extremely, very** or **moderately satisfied** with aspects of medical practice, by jurisdiction

| Jurisdiction | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. | CMWF avg. |
|-------------------------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------|
| Practising medicine | 91 ^b | 94 ^b | 79 ^c | 92 ^b | 91 ^b | 85 ^c | 94 ^b | 94 ^b | 95 ^a | 83 ^c | 91 ^d | 88 ^c | 91 |
| Their income from medical practice | 69 ^c | 84 ^b | 62 ^c | 79 ^b | 93 ^a | 63 ^c | 87 ^a | 80 ^b | 86 ^b | 67 ^c | 94 ^d | 76 ^c | 80 |
| The time they can spend per patient | 69 ^a | 80 ^a | 51 ^c | 72 ^a | 81 ^a | 64 ^b | 71 ^a | 67 ^b | 81 ^a | 49 ^c | 71 ^d | 69 ^a | 62 |
| Their daily workload | 57 ^b | 66 ^b | 38 ^c | 64 ^a | 65 ^a | 51 ^b | 62 ^a | 63 ^a | 69 ^a | 48 ^b | 60 ^d | 57 ^a | 52 |

Table 12b Proportion of primary care physicians who feel **extremely** or **very stressed** with their job as a primary care physician,[†] by jurisdiction

| Jurisdiction | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. | CMWF avg. |
|--------------|-----------------|------------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------|
| Percentage | 46 ^b | 48 ^{*b} | 61 ^c | 42 ^b | 34 ^a | 55 ^c | 43 ^b | 45 ^b | 40 ^b | 48 ^b | 49 ^d | 46 ^b | 45 |

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

† Lower results are more desirable.

a: Above average.

b: Same as average.

c: Below average.

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results). Above-average results are more desirable relative to the international average, while below-average results often indicate areas in need of improvement.

Access to care

Key findings

- More Canadian primary care physicians offer weeknight (57%) and weekend (50%) appointments compared with the CMWF average (weeknight: 44%; weekend: 36%). However, only 49% of Canadian primary care physicians have arrangements for patients to be seen when their practices are closed, lower than the CMWF average (75%).
- 22% of Canadian primary care physicians offered patients the option to request appointments online in 2019, compared with 11% in 2015.
- Fewer Canadian primary care physicians (23%) offer patients the option to ask medical questions via email or a secure website compared with the CMWF average (65%). There are also fewer Canadian primary care physicians (18%) who frequently make home visits compared with the CMWF average (42%).

More Canadian primary care physicians offer weeknight and weekend appointments than CMWF average

Table 13a Proportion of primary care physicians whose practices offer appointments **after 6 p.m. during the week** (i.e., Monday to Friday) **at least once a week**,[†] by country

| Country | Percentage |
|----------------|-----------------|
| France | 91 |
| United Kingdom | 75 |
| Germany | 63 |

| Alta. | 9 ^{*c} |
| B.C. | 14 ^{*c} |
| Terr. | 18 ^{*d} |

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

— Data is suppressed due to extreme sampling variability (CV>33.3%).

c: Below average.

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

In 2015, 19% of Canadian primary care physicians frequently made home visits (below the CMWF average of 39%),⁴ similar to this year's Canadian result (18%).

Patient-centred care

Key findings

- The majority of Canadian primary care physicians feel well prepared to care for patients with chronic conditions (82%). In contrast, fewer Canadian primary care physicians feel prepared to care for patients with specialized needs, particularly dementia (40%), palliative care (36%) and substance use (19%) — below the CMWF averages (46%, 51% and 22%, respectively). In Canada, 13% of primary care physicians reported feeling well prepared to care for patients requesting medical assistance in dying (Canada only).

Few primary care physicians in Canada and internationally well prepared to care for patients with substance-use conditions

Table 20 Proportion of primary care physicians whose practice is **well prepared**, with respect to having sufficient skills and experience, to manage care for patients with specialized needs, by type of need

| Type of need | Canada | CMWF average |
|--|-----------------|--------------|
| Chronic conditions | 82 ^c | 84 |
| Mental illness (e.g., anxiety, mild or moderate depression) | 61 ^b | 62 |
| Dementia | 40 ^c | 46 |
| Substance-use conditions (e.g., drug, opioid or alcohol use) | 19 ^c | 22 |

Notes

b: Same as average.

| Switzerland | 45 |
| Australia | 40 |
| Canada | 36 ^c |
| Sweden | 34 |
| United States | 33 |
| France | 25 |

Note

c: Below average.

Palliative care rotations are currently not mandatory for family physicians in Canada;⁷ completing one is recognized with a Certificate of Added Competence as an enhanced skill.⁸ This may explain why few Canadian primary care physicians feel well prepared to care for patients with palliative needs.

In total, 8.5% of Canadian primary care physicians have a practice focus in palliative care.⁵

Provincial and territorial snapshot: Palliative and end-of-life care

Table 27 End-of-life care, by proportion of primary care physicians and jurisdiction

| Jurisdiction | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. | CMWF avg. |

The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Did you know?

Medical assistance in dying is not considered part of palliative care, but it is an end-of-life option for Canadians who meet the legal criteria.

Between December 10, 2015 (when the law was enacted) and October 31, 2018, there were 6,749 medically assisted deaths in Canada.⁹

Coordination within the health system

Key findings

- While more Canadian primary care physicians send information to specialists (90%) compared with the CMWF average (85%), timely transfer of information back from specialists is lower in Canada (17% versus 21%).
- The proportions of Canadian primary care physicians who usually receive notifications that patients had visited the emergency department (49%) and had been hospitalized (54%) are similar to the CMWF averages (51% and 55%, respectively).
- Fewer Canadian primary care physicians communicate with home care providers about their patients' needs (24%) compared with the CMWF average (31%). However, about the same proportion of Canadian physicians receives updates about their patients (36% versus 37%).

Two-way communication between primary care physicians and specialists

Table 29 Proportion of primary care physicians who responded that they **usually** do the following when their patients have been referred to a specialist

| Activities | Canada | CMWF average |
|---|-----------------|--------------|
| Send the patient history and the reason for the consultation to the specialist | 90 ^a | 85 |
| Receive from the specialist information about changes made to the patient's medication or care plan | 59 ^b | 58 |
| Receive a report with the results of the specialist visit within 1 week of service | 17 ^c | 21 |

Notes

- a: Above average.
- b: Same as average.
- c: Below average.

In 2016, 13% of Canadians reported that their specialist did not have basic information or test results from their regular doctor about the reason for their visit,² and 21% reported that their regular doctor did not seem informed and up to date about the care they received from the specialist.²

Provincial and territorial snapshot: Communication with specialists

Table 30 Proportion of primary care physicians who responded that they **usually** do the following when their patients have been referred to a specialist, by jurisdiction

Coordination with social services

Key findings

- Although many Canadian primary care physicians (60%) screen their patients for social needs, similar to the CMWF average (60%), fewer frequently coordinate care with social services (43%) compared with the CMWF average (46%). One of the biggest challenges is inadequate staffing to make referrals and coordinate (43%), though the top challenge differs across jurisdictions.

Fewer Canadian primary care physicians frequently coordinate care with social services compared with CMWF average

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

— Data is suppressed due to extreme sampling variability (CV>33.3%).

† Excludes respondents who answered "Do not coordinate with social services."

a: Above average.

b: Same as average.

c: Below average.

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

Lower results are more desirable.

The CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Coordination using information technologies

Key findings

- More Canadian primary care physicians were using EMRs in 2019 (86%) than in 2015 (73%), but this was still lower than the CMWF average (93%).
- Compared with the CMWF average, fewer Canadian primary care practices offer their patients the option to electronically view their information and make requests, including viewing test results online (Canada: 34%; CMWF: 37%), viewing patient visit summaries online (Canada: 5%; CMWF: 26%) and requesting prescription renewals online (Canada: 10%; CMWF: 52%).
- Fewer Canadian primary care practices can exchange information electronically with doctors outside their practice compared with the CMWF average, including patient clinical summaries (Canada: 25%; CMWF: 63%), laboratory and diagnostic test results (Canada: 36%; CMWF: 65%) and lists of medications taken by their patients (Canada: 33%; CMWF: 62%).
- Compared with the CMWF average, fewer Canadian primary care physicians review their performance on clinical outcomes (Canada: 34%; CMWF: 60%), patients' hospital admissions (Canada: 25%; CMWF: 32%), prescribing practices (Canada: 26%; CMWF: 58%), surveys of patient satisfaction and experiences with care (Canada: 17%; CMWF: 38%) and surveys of patient-reported outcome measures (Canada: 8%; CMWF: 22%).

Canadian primary care physicians catching up in use of EMRs

Table 40 Proportion of primary care physicians who use EMRs in their practice (not including billing systems), by country

| Country | Percentage |
|----------------|-----------------|
| New Zealand | 100 |
| Norway | 100 |
| United Kingdom | 100 |
| Netherlands | 99 |
| Sweden | 99 |
| Australia | 97 |
| CMWF average | 93 |
| United States | 92 |
| Germany | 89 |
| France | 88 |
| Canada | 86 ^c |
| Switzerland | 71 |

Note

c: Below average.

Factors that contribute to greater EMR use include younger age and working primarily in physician group practices.

85% of family physicians use electronic records to enter and retrieve clinical patient notes.⁵

In 2015, 73% of Canadian primary care physicians used electronic patient medical records in their practice (below the CMWF average of 88%).⁴

Provincial and territorial snapshot: EMR use

Table 41 Proportion of primary care physicians who use EMRs in their practice (not including billing systems), by jurisdiction

| Jurisdiction | Percentage |

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

— Data is suppressed due to extreme sampling variability (CV>33.3%).

b: Same as average.

c: Below average.

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Perception of health system performance

Key findings

- 22% of Canadian primary care physicians think that the quality of medical care their patients receive throughout the health system has improved compared with 3 years ago, higher than the CMWF average (19%).
- 62% of Canadian primary care physicians rated the overall performance of the health care system as very good or good, lower than the CMWF average (70%).
- 65% of Canadian primary care physicians think that better integration of primary care with hospitals, mental health services and community-based social services is the top priority in improving quality of care and patient access.

More Canadian primary care physicians think quality improved, but fewer rate overall performance favourably compared with CMWF average

Table 51a Proportion of primary care physicians who think the quality of medical care their patients receive throughout the health care system has improved, has become worse or is about the same as 3 years ago, by country

| Country | Improved | About the same | Worse |

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

— Data is suppressed due to extreme sampling variability (CV>33.3%).

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Physicians identified patient requests as biggest barrier to reducing low-value or potentially wasteful care in Canada

In some countries, increasing attention is being given to treatments that may be of low value or that could potentially be wasteful.

Table 55 Proportion of primary care physicians who responded that the following are **major barriers** to reducing low-value or potentially wasteful care ^d

| Barriers | Canada | CMWF average |
|--|--------|--------------|
| Patient requests for unnecessary tests and treatments | 58 | 57 |
| Lack of time for shared decision-making with patients | 37 | 41 |
| Medical malpractice environment | 27 | 40 |
| Lack of tools or decision aids to help determine whether a patient will or will not benefit from a service | 23 | 27 |

Note

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

Many Canadians are aware that there are medical tests and treatments that can be unnecessary, but they need more support or tools in deciding whether to use them.¹⁰

Provincial and territorial snapshot: Barriers to reducing low-value care

Table 56 Proportion of primary care physicians who responded that the following are **major barriers** to reducing low-value or potentially wasteful care, by jurisdiction ^d

| Barriers | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. | CMWF avg. |
|--|------|--------|------|------|------|------|------|-------|-------|------|-------|------|-----------|
| Patient requests for unnecessary tests and treatments | 63 | 50* | 61 | 58 | 35 | 71 | 53 | 58 | 65 | 57 | 62 | 58 | 57 |
| Lack of time for shared decision-making with patients | 37 | 37* | 42 | 38 | 28 | 41 | 41 | 34 | 29 | 42 | 51 | 37 | 41 |
| Medical malpractice environment | 25 | 25* | 31 | 16* | 13 | 38 | 23* | 25 | 26* | 26 | 35* | 27 | 40 |
| Lack of tools or decision aids to help determine whether a patient will benefit from a service | 24 | 36* | 22* | 23 | 23 | 23 | 24 | 22 | 20* | 28 | 20* | 23 | 27 |

Notes

* The coefficient of variation (CV) is between 16.6% and 33.3%; use with caution.

d: Non-directional or no statistical tests were performed to compare with the CMWF average (e.g., territories).

The CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results).

Methodology notes

The CMWF's 2019 International Health Policy Survey of Primary Care Physicians includes responses from primary care physicians in 11 countries: Australia, Canada, France, Germany, the Netherlands, New Zealand, Norway, Sweden, Switzerland, the United Kingdom and the United States.

More detailed methodology notes, including a complete list of response rates from all countries surveyed, are available online.

In Canada, Social Sciences Research Solutions (SSRS) conducted mail and online surveys from January 29 to June 3, 2019, for the provinces (except P.E.I.), and censuses of P.E.I. and the territories from February 27 to July 30, 2019. In addition to the base sample funded by the CMWF, sample sizes were increased in Quebec and Ontario with funding from provincial organizations, and in the rest of the provinces and territories with funding from CIHI. Primary care physicians were randomly selected in the provinces (except P.E.I.); all primary care physicians in P.E.I. and the territories were invited to participate. To encourage participation, an incentive cheque of \$25 or \$100 was provided for each primary care physician selected in the provinces and territories, respectively. In total, there were 2,569 respondents in Canada, for an overall response rate of 39.3%.

Due to small sample sizes in Yukon, the Northwest Territories and Nunavut, the results from the territories are reported together (with permission/support).

Weighting of results

The survey data for Canada was first weighted by age and gender (for Ontario, Quebec and the rest of Canada). The weights were subsequently adjusted to reflect the share of each jurisdiction among Canadian primary care physicians. Benchmarks for physician distribution were derived from the CMA Masterfile, January 2018, Canadian Medical Association.

Averages and trends

For this report, the CMWF average was calculated by adding the results from the 11 countries and dividing by the number of countries. The Canadian average represents the average experience of Canadians (as opposed to the mean of provincial and territorial results). Except where otherwise noted, results were compared over time using data from previous CMWF surveys.

Trending results are for reference only, and caution should be used when interpreting the results. Some questions were modified compared with the 2015 survey (e.g., question text revised, response options added, question placement changed, translation changed).

Statistical analysis

Consistent with other published reports on CMWF data,¹¹ non-response categories such as “not sure,” “declined to answer” and “not applicable” were excluded from reporting and statistical analyses.

CIHI developed statistical methods to determine whether

- Canadian results were significantly different from the average of 11 countries; and
- Provincial results were significantly different from the international average.

For the calculation of variances and confidence intervals, standard methods for the variances of sums and differences of estimates from independent simple random samples were used, with the design effects provided by SSRS used to appropriately adjust the variances for the effects of the survey design and post-survey weight adjustments. Coefficients of variation were calculated by dividing the standard error by the estimate.

Relationships between different variables were analyzed using logistic regression modelling. A main response category was determined for each question, and responses were dichotomized such that the response value of interest was coded as 1 and all other values, excluding non-response categories, were coded as 0. Logistic regression was then used to fit this binary variable on explanatory variables with appropriate adjustment for survey weights and stratification variables using the SAS procedure SURVEYLOGISTIC for the analysis.

Demographics of survey respondents (unweighted)

| Jurisdiction | N.L. | P.E.I. | N.S. | N.B. | Que. | Ont. | Man. | Sask. | Alta. | B.C. | Terr. | Can. |

| 45–54 | 31% | 25% | 27% | 28% | 17% | 23% | 22% | 28% | 14% | 23% | 18% | 23% |
| 55–64 | 14% | 25% | 25% | 25% | 27% | 23% | 24% | 17% | 22% | 28% | 18% | 23% |
| 65+ | 14% | 18% | 18% | 8% | 13% | 16% | 13% | 13% | 10% | 12% | 14% | 13% |
| Geographic location (self-identified) | | | | | | | | | | | | |
| City/suburb | 44% | 34% | 44% | 40% | 64% | 77% | 62% | 51% | 72% | 68% | 10% | 59% |
| Small town/ rural area/ remote area | 54% | 66% | 54% | 59% | 34% | 21% | 36% | 48% | 25% | 31% | 80% | 39% |

Note

† Both local and locum physicians were surveyed in the territories. Only local physicians were included in the “total territories” analyses, whereas both local and locum physicians were included in the Canada-level analyses. As a result, the sum of the number of physicians by jurisdiction does not equal the Canada total.
